A watchword every minute of the night goeth about the
walls, to testify their vigilancy. *Sandys.*
WATER. *n. s.* [water, Dutch; pæcep, Saxon.]
1. Sir Isaac Newton defines water, when pure, to be a very
fluid salt, volatile, and void of all favour or taste; and it seems
to consist of small, smooth, hard, porous, spherical particles,
of equal diameters, and of equal specifick gravities, as Dr.
Cheyne observes; and also that there are between them spaces
so large, and ranged in such a manner, as to be pervious on
all sides. Their smoothness accounts for their sliding easily
over one another's surfaces: their sphericity keeps them also
from touching one another in more points than one; and by
both these their frictions in sliding over one another, is re-
duced the least possible. Their hardness accounts for the in-
compressibility of water, when it is free from the intermixture
of air. The porosity of water is so very great, that there is
at least forty times as much space as matter in it; for water is
nineteen times specifically lighter than gold, and consequently
rarer in the same proportion. *Quincy.*
